

Operational Transformation Roadmap

Transition from fee-for-service to value-based care

Healthcare organizations can effectively transition population health management to value-based care by following these four best practices.

1. Data

Lay the groundwork for a high-functioning analytics platform.

- Develop a vision agenda
- Build an organizational structure
- Implement a project portfolio
- Pursue practices to sustain gains

75% of hospitals have 10+ EHRs at affiliated practices and less than 2% have a single EHR at all affiliated practices¹

2. Analytics

Build a structure to align information and identify populations.

Connecting disparate data sources into a common structure allows healthcare organizations to build intelligence that enables them to succeed in financial and clinical transformation initiatives.

60% of Americans live with at least one chronic disease²

3. Finance

Balance risks and help set a sustainable course forward.

Entering at-risk contracts is necessary to achieve the appropriate financial revenues to sustain long term value-based contracts.

Less than 30% of organizations are prepared to manage costs at the individual physician level³

4. Care

Identify and implement changes in care delivery.

Care transformation helps organizations reduce clinical variation and improve cost savings.

80%

Percent of executives who agree population health is important to future success³

31%

Percentage of executives who feel prepared to take on risk³
